

2013 SOUTH DEVON HALLMARK DAMS

The North American South Devon Association in continuing efforts to stress performance and productivity, recognizes the superior females of the breed, the Hallmark Dams. To identify these cows, emphasis was placed on early puberty, breeding, early calving and superior production over time. A Hallmark Dam is the standard by which all South Devon cows can be judged.

Hallmark Dams Criteria

1. Dams must have weaned a calf born since January 1, 2012.
2. Dams must be at least 50 percent South Devon and have had a minimum of three calves.
3. The maximum age for a dam to have had her first calf is 30 months of age.
4. A maximum calving interval of 395 days.
5. Every calf produced must have weaning records submitted.
6. A progeny average 205-day adjusted weaning weight ratio of at least 105.

The following list recognizes 113 South Devon cows bred and owned by 22 South Devon breeders. The first table lists each individual Hallmark Dam and her current owner. The next table shows the 69 sires of these distinguished dams, while the last table lists all breeders of these Hallmark Dams. Once a dam reaches this status she will continue to be recorded in the database as a Hallmark Dam.

2013 HALLMARK DAM SUMMARY - DAM LISTING

2014 SOUTH DEVON NATIONAL CATTLE EVALUATION

ANALYSIS DESCRIPTION

Agricultural Business Research Institute • University of New England, Australia

Welcome to the 2014 South Devon Sire Summary. This brings you the most current EPDs available on sires within the breed analyzed by the Agricultural Business Research Institute. This analysis features a new crossbred analysis which now accounts for hybrid vigor and heterosis differences. This allows for all animals to be compared regardless of their percentage South Devon. These changes have resulted in larger more meaningful contemporary groups.

Summary

The North American South Devon Association in coordination with ABRI and AGBU have utilized the full crossbred analysis structure in 2010 to better account for other breed animals being used in seedstock producers' breeding programs to allow for the genetic component to be more accurately reflected in animals' Expected Progeny Differences. The analysis has resulted in a very good correlation to the previous analysis for the growth traits of BW, WW and YW as well as SC and Milk. The largest differences were seen in the non-parent animals as would be expected as before these animals had no progeny in contemporary groups that were contributing to the EPDs derived from the analysis and these animals now have progeny that are now included in meaningful contemporary groups. Additionally, new non-South Devon animals that previously had no data in the analysis are included in the analysis. As these animals

increase the number of progeny in meaningful contemporary groups, one can expect their EPDs to more accurately reflect their true genetic merit and their accuracy values will increase correspondingly. As stated in the 2009 description, the portion of growth in the crossbred due to heterosis was not being accurately accounted for and was instead being considered as genetics for the non-South Devon animal. Therefore, in some cases, the actual genetic component for these non-South Devon animals is less and their resulting EPD for growth and milk is lower as would be expected. This results in EPDs that are more reliable and a better indicator of an animal's true genetic merit.

Conclusion

This analysis of the South Devon breed was run using the latest version of the BREEDPLAN software. This software is a significant advance in the analytical techniques for genetic evaluation of livestock. The inclusion of techniques for evaluating other breed genetic contributions and the effects of heterosis, result in the 2013 North American South Devon Association analysis to be considered the most accurate and complete analysis undertaken to date. The results of this analysis are not comparable to previous methods due to the changes in formulation and comparisons should not be made on an individual animal's EPDs from the previous analysis.

ACC - ACCURACY

Accuracy (ACC) is an expression of reliability of the EPD and may range from 0 to 1. As accuracy approaches 1.0, the EPD is more reliable and can be expected to change less in the future as more progeny data are accumulated. By reliability, we mean how certain we are that the EPD represents the true genetic merit it estimates.

Accuracy may be categorized into low, medium and high reliability as follows. Low: 0.0 to .40; Medium: .40 to .70; High: .70 to 1.0. Sires with desired EPD values and high accuracy can be used with confidence that they will favorably contribute to herd improvement. Sires with low accuracy can be considered good prospects but might be used on a limited basis to minimize risk. Low accuracy values represent situations where calculated EPDs rely heavily on the records of related individuals since few or no progeny records are available. These EPDs are our best estimate of the sires potential at the time; but are associated with a greater degree of uncertainty.

| Accuracy | Birth (lb) | Weaning (lb) | Yearling (lb) | Milk (lb) | Scrotal (cm) | CarcWt (lb) | Rib fat (inch) | REA (inch ²) | MARB (score) |

EPD - EXPECTED PROGENY DIFFERENCE

Expected Progeny Differences (EPDs) may be used to estimate how future progeny of the animal will compare to progeny of other animals within the breed. To effectively use the Sire Summary, consideration must also be given to specific goals, management and environmental conditions, present level of production, herd strengths and deficiencies, and other economically important traits such as soundness.

EPDs are reported in +/- pounds for the different growth traits and are computed from a genetic evaluation system, which combines performance information currently available on the sire, his progeny, and related individuals into one value which estimates genetic transmitting ability. The analysis of the data considers and adjusts for the level of competition within a herd, genetic trend within the breed, and genetic

merit of the mates, thus making EPDs on across-the-breed evaluation allowing comparison of sires produced and utilized in different herds in different years on an equal basis.

EPDs in the South Devon Sire Summary are breed specific and cannot be compared directly to EPDs of cattle in other breeds. The genetic reference points are not the same for different breeds and therefore a +10 lb. Weaning EPD in one breed does not have the same meaning in any other breed. The summary is designed to help identify differences within the breed; information from designed breed evaluation studies is available for making breed comparisons. There are conversion tables that allow EPDs to be compared across breeds, however the accuracy of those tables has not been verified.

CONTEMPORARY GROUP DEFINITIONS

All EPDs are based on comparisons of calves within the same contemporary group. Most inaccuracies in EPDs are associated with incorrect reporting of contemporary group information. Submitting accurate performance information on all animals is a necessity in any genetic evaluation program. An animal's performance record needs to be included with it's peers to accurately contribute to it's EPDs. Likewise, contemporary groups with no variation (ie, all Docility scores 1) provide no value to the analysis either.

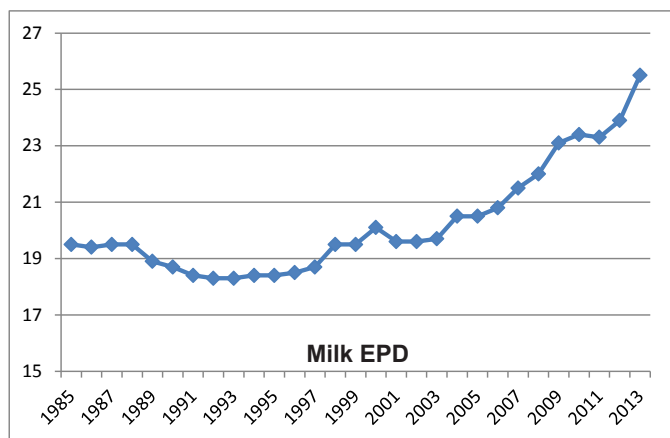

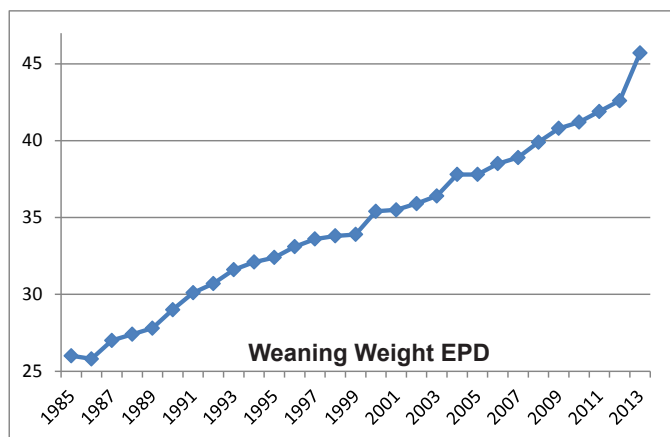

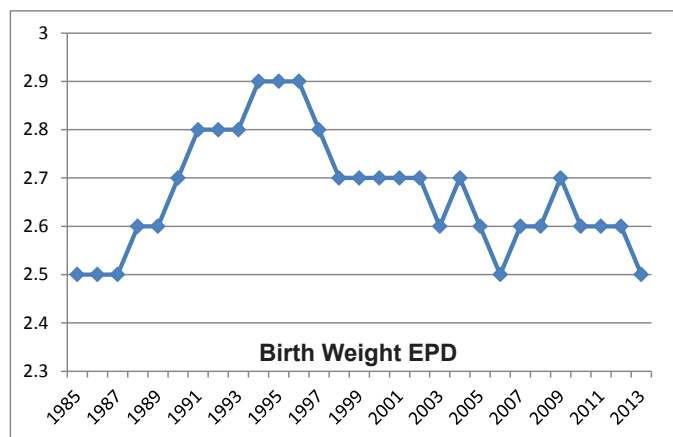

Contemporary Groups consist of animals of the:

- I. same sex
- II. born in the same herd and season (within 60 days)
- III. managed together and treated alike
- IV. same weigh date

SOUTH DEVON GENETIC TREND

The following Genetic Trend table illustrates the genetic trends in the South Devon breed. All animals in the analysis were used to generate this information. The EPD changes in weaning

and yearling growth are quite substantial, while maternal milk and birth EPD changes are light.

CRITERIA FOR LISTING IN SIRE SUMMARY

Main List of Active Sires (215 Sires)

In order to appear in the main listing, a bull must be at least 87.5 percent South Devon. The main list includes sires that have been thoroughly sampled and evaluated in the current population. Sires must have a weaning accuracy of at least .45 and have had performance progeny born since January 1, 2009.

Genetic Indicator Supplement (29 Sires)

The genetic indicator supplement includes active sires born since January 1, 2006, having a weaning accuracy of at least .35 but did not meet the minimum accuracy of .45 to make the main list. The purpose of the genetic indicator supplement is to provide preliminary data on the most heavily used young sires.

| B: NASDA MEMBER | O: NASDA NEW MEMBER | | | | | | | | | | | |

- Sire Information** – Sires are listed in alphabetical order according to their registered name followed by registration number. Also included are the bull's birthdate, breed percentage, recorded color, recorded horned-polled-scurred condition; sire(S), dam(D), breeder (B), and current owner(s) (O).
- #Herds (Number of Herds)** – The number of herds in which progeny have been reported.
DC (Number of Daughters'Calves) – The number of daughters' calves reported with weaning weights contributing to the maternal milk EPD. Number of daughters should not be used in lieu of accuracy, but simply to further clarify Maternal Milk and Maternal Weaning Weight accuracy values.
- BW (Birth Weight)** – Progeny from the above sire can be expected to weigh 1.5 lbs. less at birth than progeny sired by a bull with an EPD of +2 (+0.5 minus 2 = 1.5 lbs.)
- WW (Weaning Weight)** – Calves sired by the above bull should have a 35 lb. advantage in 205-day adjusted weaning weight compared to calves sired by a bull with an EPD of +4. (39 minus 4 = 35)
- YW (Yearling Weight)** – His progeny should be 45 lbs. above the average of progeny of a bull with an EPD of 30 lbs. (75-30=45)
- MWW (Maternal Weaning Weight)** – weaning weights averaging 11 lbs. heavier than progeny of a bull's daughters with a MWW EPD of 20 lbs. (41-20=21 lbs.)
- MILK (Maternal Milk)** – 205-day weights averaging 11 lbs. more as a result of greater milk production than daughters of a bull with a maternal milk EPD of 10. (21-10=11lbs.)
- Scrotal Circumference (SC)** – Scrotal Circumference EPD evaluates the scrotal size of bulls in centimeters from yearling bull data. Scrotal circumference is a good indicator of puberty, fertility, semen quality and quantity. Increases in scrotal size will also result in decreased age of puberty in daughters and greater lifetime production. Positive values indicate larger scrotal circumference.
- Marbling EPD (Marb)** — expressed as a fraction of the difference in USDA marbling score of a sire's progeny compared to progeny of other sires.
- Carcass Weight EPD (CW)** — expressed in pounds is a predictor of the differences in hot carcass weight of a sire's progeny compared to progeny of other sires.
- Fat Thickness EPD (Fat)** — expressed in inches, is a predictor of the differences in external fat thickness at the 12th rib (as measured between the 12th and 13th ribs) of a sire's progeny compared to progeny of other sires.
- Ribeye Area EPD (REA)** — expressed in square inches, is a predictor of the difference in ribeye area of a sire's progeny compared to progeny of other sires.
- Retail Yield % EPD (RY)** — estimates the genetic differences between animals in percentage retail beef yield for a standard carcass weight of 750 lb. Positive EPD values indicate a higher percentage retail yield at the same carcass weight.

HERITABILITY ESTIMATES

Heritability is the portion of the total variation in phenotype among animals that is due to genes that are passed on to offspring. Heritabilities range from 0 to 1. The estimates used are based upon data reported to NASDA. The heritability estimates used in the National Cattle Evaluation are as follows:

| Trait | Heritability |
|-----------------------|--------------|
| Birth Weight | .35 |
| Weaning Weight | .26 |
| Yearling Weight | .31 |
| Maternal Milk | .21 |
| Scrotal Circumference | .42 |

CARCASS EPD ANALYSIS HERITABILITY ESTIMATES

Heritability is the portion of the total variation in phenotype among animals that is due to genes that are passed on to offspring. Heritabilities range from 0 to 1. The estimates used are based upon data reported to NASDA. The heritability estimates used in the National Cattle Evaluation are as follows:

| TRAIT | HERITABILITY | TRAIT | HERITABILITY |
|----------------|--------------|------------------------------|--------------|
| Weaning Weight | 0.33 | Fat Thickness | 0.36 |
| Ribeye Area | 0.35 | Ultrasound Ribeye Area | 0.41 |
| Marbling | 0.29 | Ultrasound Intramuscular Fat | 0.28 |
| Carcass Weight | 0.42 | Ultrasound Back Fat | 0.56 |

CARCASS EPD ANALYSIS

There is both ultra-sound scan data and actual slaughter data in the evaluation. Scan records are adjusted to a constant age of 365 days, whereas carcass (slaughter) weight is adjusted

to 450 days - all other slaughter traits are adjusted to a 750 lb constant carcass weight.

PERCENTILE CHARTS

On the following two pages are percentile breakdown tables. Information is given for all South Devon active sires, dams, non-parents and all calves born in 2012. These tables can be utilized to compare an individual to the total South Devon population. For example, you want to know how your sire, with a +93 Yearling EPD compares with other sires in

the South Devon breed. You will find from the Sire Percentile table that he is at the 5% level. There are 5% of the South Devon with a higher Yearling Weight EPD. In other words, he is higher than 95% of all South Devon sires. Similar comparisons can be made with dams or non-parents.

All Sires

The trait averages, ranges and percentiles are given on all sires to allow comparative evaluation on a bull of particular interest in relation to where the bull ranks in the population of South Devon bulls.

All Dams

EPDs of dams are generally based on fewer progeny records than sires and are associated with lower accuracy values. As prediction of genetic merit, they are useful for planning matings and evaluating the cowherd.

| All Dams — EPD Means and Ranges | | | | | | |
|---------------------------------|-------|-------|-------|-------|-------|-------|
| | BW | WW | YW | MWW | MM | SC |

Non-Parents

Non-parent animals EPDs are based on the animal's own performance and the performance of related individuals. Although low in accuracy, these estimates are superior to using adjusted weights and ratios, and are important in the selection and merchandising of young breeding stock.

Animals Born in Year 2012

These animals are the most current, complete group of non-parents available. Young sires and dams born in 2012 can be evaluated using this chart.

| All Non-Parents — EPD Means and Ranges | | | | | | |

BALANCED TRAIT LEADERS

This list contains bulls that are below breed average for birth weight and above breed average for weaning, yearling, and milk EPD. To make the list an accuracy of .40 or better is required for birth weight and weaning weight.

2014 SOUTH DEVON TRAIT LEADERS

Sires are recognized as Trait Leaders in ten areas: birth weight, weaning weight, yearling weight, maternal weaning weight, scrotal circumference, marbling, carcass weight, fat thickness, ribeye area and balanced trait leader for the genetic indicator sires. Trait leader designation is strictly a recognition program. It is not an attempt to identify a "best" bull. The top 10 sires are recognized in each category, which represents approximately the top one percent of all sires in the South Devon breed.

In order to qualify as one of the Trait Leaders, a sire must have a minimum accuracy of .40 for birth, weaning and yearling weights. A .30 milk accuracy is required for maternal milk. Sires need only produce calves in one herd. The top 10 sires (plus ties) according to their EPD values that meet the minimum accuracy requirements are designated as Trait Leaders for the particular trait.
